GLOBAL BUSINESS MANAGEMENT CONSULTANTS

Improving Performance Through Project Management

WORLD'S "top project management solution provider."

Global Business Management Consultants is an elite, international consulting firm specializing in Project Management training, organizational development and consulting. Founded in 1985, Global Business Management Consultants (GBMC) is recognized worldwide for its leading edge project management knowledge that has helped 100s of Fortune 500 companies excel in project management practice.

GBMC provides project management best practice support and addresses project challenges of private and public organizations around the world in 14 languages. GBMC's consultants will design and structure appropriate consulting, training or organizational intervention to address specific needs at each level of your organization from entry level to executive management. This can be as basic as introducing project management tools and techniques to new managers or as complex as assisting your company's transition into a true project-based system of operation. Project Management, that is consistent, crossfunctional application of project management at all levels of the organization on a global basis, is GBMC's speciality.

In an independent study of over 600 companies, GBMC was ranked as the world's "top project management solution provider."

Since 1987 GBMC has worked with NASA as an integral part of its Project Management programs. GBMC's The Art of Project Management® remains a basis for NASA project management training. NASA managers have publicly stated that GBMC consultants are "the best project management trainers in the US". In addition, BMC is "The Official Strategic Project Management Advisor" to Airbus, and the CFO said that "GBMC's workshops have been the most successful thing we have done to develop our senior population".

GBMC's reputation for excellence makes it one of the most highly sought after project management services provider worldwide.

"the best project management trainers in the US".

GBMC Services

Diagnosis/Assessment

GBMC provides a number of diagnostic services to define an organization's 'as-is' situation, from which issues and improvements can be defined into an overall 'blueprint', or 'road map' that provides directions.

Coaching, Facilitation and Management

GBMC recognizes that its clients frequently require follow-up support, neutral coordination, external knowledge, and sometimes just an 'extra pair of hands' to do the job.

Competency Mapping and Career Development

GBMC designs, develops and implements competency models that include such elements as tiered project management career 'ladders' aligned to existing resource groups; defined roles and competency requirements for project personnel incorporating procedural responsibilities; a defined 'benchmark' of competence for different roles; the mapping of training and development to competency profiles; tools that consistently assess performance and ability against the 'benchmark' target; and map remuneration specific for project management.

Project Office Development and Consultancy

GBMC offers its clientele a variety of interventions in developing project offices, at an enterprise (portfolio), program, and/or project level.

Professional Development

has been GBMC's core component for over 26 years. GBMC has a full curriculum of project management related development, each registered with the Project Management Institute (PMI®).

Methodology and Tools

GBMC designs, develops and implements project management governance, process, procedures, templates and tools.

Technology & Automation

is often used as a starting point to improve project management performance, usually with inadequate and ineffective results. Diagnosis and assessment of existing business process should always be the first steps in any technology implemented solution. From this the selection of the appropriate automation platform can be identified and the development of integrated business process and practice be implemented in parallel. GBMC adopts this approach before automating project management practice; this can be a minor or major activity depending on the existing maturity of the organization's project management approach, and allows the carefully selection of an automating technology that meets actual need, rather than selecting on the basis of software sales speculation.
