

Rotor Balancing Service

Technical Description

PVFM Ltd have invested in an advanced two plane balancing system capable of rebalancing all rotating equipment found in agriculture, forestry and general industrial applications.

This allows us to rebalance mulcher rotors, chipper drums and stump grinder disks following repair and rebuilds.

We can carry out this service in our workshops or on site.

Correct balance is important as it reduces wear on the machine and operator alike. Even small imbalance can have serious effect particularly on the electronics of modern tractors.

One thing to note; it is very important to ensure the machine to be balanced is fitted with new tools, wear plates etc. and that the remainder of the drive line is in good order. It is pointless spending time and money balancing a rotor with worn out teeth!

Please contact us for all your balancing needs.
